Materials for the aquatic hemiptera (Heteroptera) fauna of the Charyn State National Natural Park

As a result of research in 2019, 21 species out of 7 families of Hemiptera were identified in the Charyn State National Natural Park. From these species composition, 14 species are zoophages; the remaining 7 species are zoophytophages. Identified all species have a wide selection of hunting objects, feed on aquatic invertebrates, including regulating the numbers of blood-sucking mosquito larvae (Culicidae). The main purpose of the research is to identify the species composition of the aquatic hemiptera Charyn State National Natural Park. Here, a systematic special study of the fauna of the aquatic hemiptera was not carried out before. Only 2 articles on half-winged animals have been published. Aquatic Hemiptera insects by species diversity and environmental features are one of the groups most suitable for its use in various environmental studies; they are well adapted to various environmental conditions.

Keywords: fauna, Heteroptera, Charyn State National Natural Park, family, larva.

Introduction

Hemiptera is a vast group of insects with a moderately flattened body, piercing-sucking mouth type of oral organs belonging to insects with incomplete transformation, in which the intermediate stage between egg and imago is called nymph.

Aquatic Hemiptera are insects, all their life and development of which takes place in water bodies. They are divided into 2 ecological groups: Gerromorpha — water strides (5 families) living on the surface of water or wet banks of water bodies, and Nepomorpha — water bugs (8 families) living in the thickness of water or on the bottom.

Practically all water bedbugs are predators, only species of Corixidae family can feed on both animal foods and algae and detritus. Many species kill larvae and mummies of blood-sucking insects living in water. Some species harm fish farming by attacking caviar and midge. Water bugs themselves and their numerous larvae are the object of nutrition for aquatic and semi-aquatic animals [1, 2].

Materials and methodology

The material of this work is the collections of authors in 2019 in the territory of Charyn State National Natural Park. Various techniques [3–7] have been used to collect Hemiptera: fishing of entomological water dip nets, night fishing, etc. The fauna of water Hemiptera of Charyn State National Natural Park is not fully reflected in this work, because it hasn't been studied in depth yet. The following are species found in the studied territories. For each of species are given the date of collection, short information on distribution, biology and ecology.

Results and discussion

Family Nepidae — Water scorpions

Nepa cinerea Linnaeus, 1758. Charyn State National Natural Park, Sharyn River. 14.07.2019, 3♀, 5♂, 24.08.2019, 4♀, 3♂. Standing and slowly flowing large and small bodies of water (live in the thickness of water, does not swim well, so walks on the bottom or water plants; Zoophage (adults and larvae feed on the larvae of dragonflies, blindness and beetles); monovoltine; Winters imago, but can also winter larvae of V age [8]).

Ranatra linearis (Linnaeus, 1758). Charyn State National Natural Park, cordon No. 4. 10.07.2019, 1♀, 2♂ found in Sharyn river, 04.08.2019, + 4 ♀, 2 ♂ +4 larvae III-I V age. Standing and slowly flowing large and small bodies of water; Zoophage (destroys fish dip nets, dragonfly larvae and beetles); Monovoltine [9, 10] or bivoltine [11]; Winters imago.

Family Corixidae — Boat Bugs

Micronecta pusilla (Horvath, 1895). Charyn State National Natural Park, bottomland of the Sharyn River, 23.07.2019, 2 ♀, 4 ♂. Standing and slowly flowing large and small bodies of water; zoophytophage; monovoltine; The larvae winter.

Cymatia coleoptrata (Fabricius, 1777). Charyn State National Natural Park, bottomland of the Sharyn River, 05.08.2019, 3 ♀, 2 ♂. Standing and slowly flowing large and small bodies of water; zoophytophage; monovoltine; Winters imago.

Hesperocorixa linnaei (Fieber, 1848). Charyn State National Natural Park, inundated standing reservoir of the Sharyn River, 10.07.2019, 5 ♀, 6 ♂. In floodwater bodies with standing water and well-developed vegetation; zoophytophage; monovoltine; Winters imago in the water basin [12].

Hesperocorixa sahlbergi (Fieber, 1848). Charyn State National Natural Park, a water body with standing water near cordon No. 4. 04.08.2019, 4 ♀, 3 ♂. Various standing and slowly flowing large and small bodies of water; zoophytophage; monovoltine; Winters imago.

Paracorixa kiritshenkoi (Lundbland, 1933). Charyn State National Natural Park, inundated reservoir of the Sharyn River, 15.07.2019, 4 ♀, 3 ♂. In the steppe zone and desert zones in floodwater bodies of rivers and lakes; zoophytophage; monovoltine; Winters imago. Flying into the light.

Sigara nigrolineata nigrolineata (Fieber, 1848). Charyn State National Natural Park, inundated standing reservoir of the Sharyn River, 06.07.2019, 9 ♀, 3 ♂. In a variety of small standing and weakly flowing water bodies; zoophytophage; polivoltine; Winters imago [5].

Sigara limitata limitata (Fieber, 1848). Charyn State National Natural Park, flood plain of the Sharyn River, 06.07.2019, 3 ♀, 3 ♂. It lives in standing or weakly flowing well-warmed water bodies with rich vegetation; zoophytophage; monovoltine; Winters imago.

Sigara striata (Linnaeus, 1758). Charyn State National Natural Park, bottomland of the Sharyn River, 14.07.2019, 3 ♀, 2 ♂. Euritope, in all sorts of standing, weakly flowing, floodwaters, but avoids heavily polluted; Zoophytophage (plant and animal food, exterminates mosquito larvae); polivoltine; Winters imago (in water bodies). Flies well and arrives at night to light [5].

Sigara distincta (Fieber, 1848). Charyn State National Natural Park, bottomland of the Sharyn River, 08.07.2019, 4 ♀, 3 ♂. In a variety of standing and floodwater bodies, in silted areas with water vegetation; zoophytophage; Polyvoltine [12]; Winter imago.

Sigara falleni (Fieber, 1848). Charyn State National Natural Park, bottomland of the Sharyn River, 10.07.2019, 5 ♀, 6 ♂. In weakly flowing, various flood and standing water bodies, river plants, lakes, including moderately contaminated ones; zoophytophage; bivoltinny; Winters imago. Lives and winters in a body of water. There is information about destruction by these bedbugs of larvae of a white fat plate in Rostov region [13].

Sigara longipalis (J. Sahlberg, 1878). Charyn State National Natural Park, bottomland of the Sharyn River, 24.08.2019, 4 ♀, 3 ♂. It lives in floodwater standing bodies: necton; zoophytophage; Polyvoltine [14]; Winters imago.

Family Naucoridae — Plautus

Ilyocoris cimicoides cimicoides (Linnaeus, 1758). Charyn State National Natural Park, bottomland of the Sharyn River, 24.06.2019, 2 ♀, 3 ♂; 02.07.2019, 2 ♀, 2 ♂; Temirlik River, 4–8.08.2019, 2 ♀, 3 ♂; 10.07.2019, 1 ♀, 2 ♂; 13.08.2019, 2 ♀, 1 ♂ larvae IIage. They live in permanent, long-term non-drying standing and slowly flowing water bodies with developed vegetation; Zoophage (prefers to eat and attack small, weakly-chitinized inhabitants of water bodies: dragonfly larvae, leeches, side-swimmers, as well as larvae of blood-sucking mosquitoes of Aedes and Culex genera); monovoltine; Imago is wintered on land, buried in soil in upper layer of soil. Winter of water creepers on land is showed in other publications [5, 8, 15].

Family Notonectidae — Back swimmers

Notonecta glauca glauca Linnaeus, 1758. Charyn State National Natural Park, bottomland of the Sharyn River, 02.07.2019, 2 ♀, 2 ♂; Temirlik River, 08.08.2019, 4 ♀, 3 ♂. Predominantly in ponds, small lakes and various floodwater bodies with standing or weakly flowing water. Zoophage, larvae of initial ages feed on small larvae of aquatic beetles, mosquitoes and fallen insects into the water. Monovoltine; Winter imago.

Family Pleidae — Pleids

Plea minutissima minutissima Leach, 1817. Charyn State National Natural Park, inundated standing reservoir of the Sharyn River, 24.08.2019, 3 ♀, 3 ♂. Standing and slowly flowing large and small bodies of

water with abundant of vegetation; Zoophage (both imago and larvae feed on larvae of various hydrobionts); monovoltine; Winters imago [8].

Hydrometridae family — Stick-shaped water strides

Hydrometra stagnorum (Linnaeus, 1758). Charyn State National Natural Park, bottomland of the Sharyn River, 02.07.2019, 2 ♀, 2 ♂; Temirlik River, 08.08.2019, 4 ♀, 3 ♂. On floating leaves of aquatic plants or along banks standing or weakly flowing water bodies, on wet soil and mosses; Zoophage (small arthropods); Possibly monovoltine; Winters imago on the shore [8].

Family Gerridae — Water strides

Gerris argentatus Schummel, 1832. Charyn State National Natural Park, bottomland of the Sharyn River, 02.07.2019, 2 ♀, 2 ♂; Temirlik River, 08.08.2019, 4 ♀, 3 ♂. It lives in water bodies with standing water and with a partially overgrown mirror, and quickly slides on the surface of the water. Zoophage; bivoltine; Winter imago.

Gerris lacustris (Linnaeus, 1758). Charyn State National Natural Park, bottomland of the Sharyn River, 02.07.2019, 2 ♀, 2 ♂; Temirlik River, 08.08.2019, 4 ♀, 3 ♂. In ponds, lakes or flood water bodies with standing water and developed vegetation, on the surface of water of different water bodies; Zoophage (small aqueous arthropods); polyvoltine; Imago is wintered [8].

Gerris costae (Herrick-Schaffer, 1850) in the territory of Kazakhstan the species is represented by the subspecies *Gerris costae fieberi* Stichel, 1938. Charyn State National Natural Park, bottomland of the Sharyn River, 02.07.2019, 2 ♀, 2 ♂; Temirlik River, 08.08.2019, 4 ♀, 3 ♂. On the surface of water of different water bodies, everywhere in puddles; zoophage; Probably bivoltine; Winters imago.

Limnoporus rufoscutellatus (Latreille, 1807). Charyn State National Natural Park, bottomland of the Sharyn River, 02.07.2019, 2 ♀, 2 ♂; Temirlik River, 08.08.2019, 4 ♀, 3 ♂. It lives in shallow flood standing water bodies with a partially overgrown water mirror, in marshy overgrown ponds, and in large lakes, sometimes along river banks, among vegetation, in shaded areas among the stems of aquatic plants, avoids an open water mirror; Ecologically plastic, very conventional species; Zoophage (gnus number regulator); polyvoltine; Imago is wintered [8] (Table 1).

Total:		21		

The nutrition of the Hemiptera is extremely diverse. By food connections, predators (zoophages) and mixed-food species (zoophytophages), which consume both plant and animal food, are distinguished among aquatic bedbugs. According to Table 1, zoophages are 45 % and zoophytophages — 55 %.

Bedbugs are characterized by wintering at different stages of development. In most species, winter diapause occurs at the imago stage, but few species winter at the larval stage. Usually the first to appear are species wintering at the imago stage (Table 1), such species majority (90 %) and at the larval stage (10 %).

Hemiptera of Charyn State National Natural Park is characterized by 3 known types of voltinism: monovoltinism (one generation per year) — 11 species (52 %), bivoltinism (two generations per year) — 4 species (19 %), polyvoltinism (more than two generations per year) — 6 species (29 %).

Conclusions

As a result of studies carried out on the territory of the Charyn State National Natural Park, 21 species of Aquatic Hemiptera out of 7 families were identified. The largest in volume were collection of representatives of family Corixidae is 11 species, Gerridae is 4 species, with only 1–2 species known in the rest of the families. According to food connections among water bugs of Charyn State National Natural Park zoophages make up — 45 %, zoophytophages — 55 %. Bedbugs are characterized by wintering at different stages of development, here wintering at the stage of imago 90 % and at the stage of larvae 10 %. Hemiptera Charyn State National Natural Park is characterized by 3 types of voltinism: monovoltinism — 52 %, bivoltinism — 19 %, polyvoltinism — 29 %.

Шарын мемлекеттік ұлттық табиғи паркіндегі су жартылайқаттықанаттылар (Heteroptera) фаунасы

2019 жылы Шарын мемлекеттік ұлттық табиғи паркінде (МҰТП) жүргізілген зерттеулер нәтижесінде жартылайқаттықанаттылардың 7 түкімдасқа кіретін 21 түрі анықталды. Олардың 14 түрі — зоофагтар, қалған 7 түрі — зоофитофагтар. Анықталған барлық түрлерде аң аулау нысандары кең, су омыртқасыздарымен қоректенеді, соның ішінде қан соратын масалардың личинкаларын (*Culicidae*) реттейді. Зерттеудің негізгі максаты — Шарын мемлекеттік ұлттық табиғи паркіндегі су жартылайқаттықанаттылардың түрлік құрамын анықтау. Мұнда бұрын су жартылайқаттықанаттылар жануарлар дүниесіне жүйелі түрде арнайы зерттеу жүргізілген жоқ. Осылан дейін су жартылайқаттықанаттылар туралы тек 2 макала жарияланды. Су жартылайқаттықанаттылар түрлерінің көп түрлілігі мен қоршаган ортаның ерекшеліктері бойынша әр түрлі экологиялық зерттеулерде қолдануға қолайлыш топтардың бірі болып табылады және олар әр түрлі экологиялық жағдайларға жақсы бейімделген.

Кітт сөздер: фауна, жартылайқаттықанаттылар, Шарын МҰТП, түкімдас, личинка.

Материалы к фауне водных полужесткокрылых (Heteroptera) Чарынского государственного национального природного парка

В результате исследований в 2019 г. в Чарынском государственном национальном природном парке (ГНПП) выявлен 21 вид из 7 семейств полужесткокрылых. Из них 14 видов зоофаги, остальные 7 — зоофитофаги. Все виды имеют широкий выбор охотничьих объектов, питаются водными беспозвоночными, в том числе регулируют численность личинок кровососущих комаров (*Culicidae*). Основная цель исследования — выявить видовой состав водных полужесткокрылых Чарынского государственного национального природного парка. Раньше планомерного специального изучения фауны водных полужесткокрылых не проводилось. Опубликовано всего две статьи по полужесткокрылым. Полужесткокрылые насекомые по видовому разнообразию и экологическим особенностям — одна из групп, наиболее пригодных для ее использования в различных экологических исследованиях, они хорошо приспособлены к различным условиям среды.

Ключевые слова: фауна, полужесткокрылые, Чарынский ГНПП, семейство, личинка.
